

## Announcement

October 26, 2009

Ayrshire Electronics announced today that its electronic manufacturing services (EMS) operation in Oakdale, Minnesota has achieved the prestigious ISO 13485 certification.

ISO 13485 is the quality management system (QMS) standard specific to the medical device industry. The requirements emphasize critical areas impacting process, quality and manufacturing reliability for medical device products. It is designed to enforce complicated and strict manufacturing control principals unique to the medical device industry. This certification, an internationally recognized management system standard developed by the International Organization for Standardization (ISO), is a requirement for the ongoing manufacturing of commercial medical devices.

According to Milo D. Bryant, Chairman and CEO of Ayrshire Electronics, "ISO 13485 has become the standard to which medical device suppliers are measured. The addition of ISO 13485 complements our existing ISO 9001 quality management system and reinforces Ayrshire's commitment to the medical device market."

Headquartered in Louisville, Kentucky, Ayrshire Electronics is a full service privately held Electronic Manufacturing Services (EMS) Company with six manufacturing and support facilities. Ayrshire manufactures and distributes printed circuit board assemblies and complex final assemblies supporting OEM customers across multiple market segments.
